

Exploratory Test Report

broken-workshop

Report generated	2026-09-20 16:40 UTC
Run window	2026-09-20T15:48:29.275612+00:00 to 2026-09-20T16:39:04.082666+00:00
Test cases executed	10
Defects found	0
Prepared by	Exploratory Testing Planner Agent (automated)

Every outcome in this report is attributed by the test system itself. A failed run is counted as a defect only when the application was at fault; runs lost to the limits of the automated tester or to the test environment are reported separately and are not defects.

Executive Summary

Ten test runs were executed against the broken-workshop application, totaling 170 steps over approximately 45 minutes. Five runs completed successfully and confirmed expected application behavior, while no application defects were identified. Four runs could not be completed due to automated tester limitations, and one run was blocked by an environment step limit. The most important takeaway is that the application demonstrated correct behavior in all completed tests, though several scenarios remain unverified.

Scope and Method

The test suite set out to verify the primary form's handling of various input conditions, including empty submissions, boundary lengths, special characters, numeric values, whitespace, and navigation during submission. Tests were executed through an automated agent that interacted with the live application at the specified URLs, following scripted steps and recording outcomes along with error classifications.

Why These Tests Were Necessary

These tests were selected to probe the primary form's robustness across common and edge-case user inputs, as well as its behavior during interrupted workflows. Boundary testing with maximum and near-maximum lengths, special characters, and oversized file uploads targets typical failure points in form handling. Navigation interruption tests assess state preservation, which is critical for user experience in multi-step workflows. Together, these scenarios provide meaningful coverage of the form's input validation, error handling, and state management capabilities.

What the Tests Examined

The planned tests exercised the primary form through a series of input scenarios. Empty-input submission was checked to ensure no crash or phantom record creation. Boundary tests submitted content at, just below, and exceeding the maximum allowed character length to verify truncation or error messaging. Additional submissions covered special characters, numeric input, and leading or trailing whitespace. Two tests involved navigating away from the form mid-flow and returning to verify state preservation, with one of those tests including a subsequent modified submission.

Discussion of Findings

No application defects were found during this test run. All five runs that completed successfully passed, and no misbehavior attributable to the application was recorded in any run. The application behaved as expected in every test that was able to reach a conclusion.

Limitations of This Run

Four runs were not completed due to automated tester limitations, including two timeouts, one navigation livelock, and one navigation failure. One additional run was blocked by an environment step limit. These outcomes are attributed to the testing tool or the execution environment and do not indicate defects in the application. As a result, the scenarios involving special characters, oversized file uploads, navigation interruption, and maximum-length numeric input remain unverified.

Recommendation

The five unverified scenarios should be re-run using an automated tester with increased timeout allowances and navigation stability. The step limit for the boundary-length test should be raised to allow completion. If these runs continue to fail at the tool level, manual testing should be performed for the affected scenarios to obtain definitive results. Once all ten scenarios have been executed to completion, a final assessment of the application's form handling can be made.

Results by Attribution

OUTCOME	N	SHARE	MEANING
Passed	5	50%	the application behaved as expected
Defect	0	0%	a fault in the application under test
Tool limit	4	40%	our automated tester could not complete the run
Blocked	1	10%	test data, permissions, guardrail or step budget

Total execution effort: 170 steps across 2718 seconds. Of 10 runs, 5 produced evidence about the application; the remainder were lost to the tester or the environment and say nothing about its quality.

Knowledge coverage: 10 test cases recorded, 0 of 0 requirements covered, 0 user-interface states mapped.

Tests Executed

1. Empty-input submission on primary form should not crash or create phantom record

Passed 8 steps, 65s

Path: <https://broken-workshop.dequelabs.com/>

2. Submit primary form with input at max allowed character length and verify no truncation or error

Passed 16 steps, 123s

Path: <https://broken-workshop.dequelabs.com/>

3. Submit primary form with input containing special characters and verify proper handling

Tool limit 20 steps, 582s, recorded as TIMEOUT

Path: <https://broken-workshop.dequelabs.com/>

4. Upload a file with a very large size to the primary form and observe app behavior

Tool limit 23 steps, 206s, recorded as NAVIGATION_LIVELOCK

Path: <https://broken-workshop.dequelabs.com/>

5. Interrupt primary form submission by navigating away mid-flow, then return and verify state preservation

Tool limit 32 steps, 572s, recorded as NAVIGATION_FAILURE

Path: <https://broken-workshop.dequelabs.com/> > <https://broken-workshop.dequelabs.com/recipes>

6. Submit primary form with input exceeding max allowed length and verify graceful truncation or error message

Tool limit 9 steps, 439s, recorded as TIMEOUT

Path: <https://broken-workshop.dequelabs.com/>

7. Modify form values after navigating away and back, then submit

Passed 13 steps, 224s

Path: <https://broken-workshop.dequelabs.com/>

8. Submit primary form with numeric input that exceeds max allowed length and verify graceful truncation or error message

Passed 4 steps, 64s

Path: <https://broken-workshop.dequelabs.com/>

9. Submit primary form with input just below max allowed length and verify boundary handling

Blocked 30 steps, 260s, recorded as STEP_LIMIT_EXCEEDED

Path: <https://broken-workshop.dequelabs.com/>

10. Submit primary form with input containing leading/trailing whitespace and verify trimming or error handling

Passed 15 steps, 184s

Path: <https://broken-workshop.dequelabs.com/>

Defects and Where They Occurred

No defects were attributed to the application in this run. Note that this is not a statement that the application is free of defects, only that none were observed within the scope and budget described above.

Runs That Are Not Defects

The runs below did not complete, but the cause lies with the automated tester or the test environment rather than the application. They are excluded from the defect count above and must not be read as quality problems in the software under test.

Submit primary form with input containing special characters and verify proper handling

Tool limit: TIMEOUT - our automated tester could not complete the run

Upload a file with a very large size to the primary form and observe app behavior

Tool limit: NAVIGATION_LIVELOCK - our automated tester could not complete the run

Interrupt primary form submission by navigating away mid-flow, then return and verify state preservation

Tool limit: NAVIGATION_FAILURE - our automated tester could not complete the run

Submit primary form with input exceeding max allowed length and verify graceful truncation or error message

Tool limit: TIMEOUT - our automated tester could not complete the run

Submit primary form with input just below max allowed length and verify boundary handling

Blocked: STEP_LIMIT_EXCEEDED - test data, permissions, guardrail or step budget
